Najd Alqahtani**

This project's goal is to predict whether or not a patient has heart disease.

"A healthy heart is the main source of your strength."

To begin, we've looked at target distribution categories 0 and 1 where Category 0 has no disease and Category 1 has disease. As shown in the plot, there is a balance between the two classes, so we will consider accuracy, as well as the number of incorrect predictions for people with heart disease (Recall).

Logistic Regression Confusion Matrix

0	162	27
1	27	194
	0	1

We started building the LogisticRegression model and we got an accuracy of 86 . The false negative is 27, as shown in the Confusion Matrix, which is a rather low value, but we hope to reduce it further by building more models such as (Random Forest, Extra Trees Classifier and Support Vector Machine).
